On sufficient conditions for Carathéodory functions

Dingong Yang, Shigeyoshi Owa, and Kyohei Ochiai

Abstract

By using the method of differential subordinations, we derive certain sufficient conditions for Carathéodory functions. Our results extend and improve some results due to Nunokawa et al. [*Indian J. Pure Appl. Math.*, 33(2002), 1385 - 1390], Owa and Obradović [*Bull. Austral. Math. Soc.*, 41(1990), 487 - 494], Li and Owa [*Indian J. Pure Appl. Math.*, 33(2002), 313 - 318], and Tuneski [*Internat. J. Math. Math. Sci.*, 23(2000), 521 - 527].

1 Introduction

Let $\mathcal{P}$ be the class of functions $p(z)$ of the form

$$p(z) = 1 + \sum_{n=1}^{\infty} p_n z^n$$

which are analytic in the unit disk $\mathbb{E} = \{z \mid |z| < 1\}$. If $p(z)$ in $\mathcal{P}$ satisfies $\mathrm{Re}\ (p(z)) > 0$ for $z \in \mathbb{E}$, then we say that $p(z)$ is the Carathéodory function.
Let $f(z)$ and $g(z)$ be analytic in $\mathbb{E}$. Then we say that $f(z)$ is subordinate to $g(z)$ in $\mathbb{E}$, written $f(z) \prec g(z)$, if there exists an analytic function $w(z)$ in $\mathbb{E}$ such that $|w(z)| \leqq |z|$ and $f(z) = g(w(z))$ $(z \in \mathbb{E})$. If $g(z)$ is univalent in $\mathbb{E}$, then the subordination $f(z) \prec g(z)$ is equivalent to $f(0) = g(0)$ and $f(\mathbb{E}) \subset g(\mathbb{E})$.
Let $\mathcal{A}$ be the class of functions $f(z)$ of the form

$$f(z) = z + \sum_{n=2}^{\infty} a_n z^n$$

which are analytic in $\mathbb{E}$. A function $f(z)$ in $\mathcal{A}$ is said to be starlike of order α in $\mathbb{E}$ if it satisfies

$$\mathrm{Re}\left(\frac{zf'(z)}{f(z)}\right) > \alpha \quad (z \in \mathbb{E})$$

2000 *Mathematics Subject Classification*: Primary 30C45.
Key Words and Phrases: Carathéodory function, starlike function, subordination.

for some α $(0 \leqq \alpha < 1)$. We denote by $\mathcal{S}^*(\alpha)$ $(0 \leqq \alpha < 1)$ the subclass of $\mathcal{A}$ consisting of all starlike functions of order α in $\mathbb{E}$. Also we denote by $\mathcal{S}^*(0) = \mathcal{S}^*$. For $-1 \leqq a \leqq 1$, $-1 \leqq b \leqq 1$ and $a \neq b$, a function $f(z)$ in $\mathcal{A}$ is said to be in the class $\mathcal{S}^*(a,b)$ if satisfies

$$\frac{zf'(z)}{f(z)} \prec \frac{1+az}{1+bz} \qquad (z \in \mathbb{E}).$$

The class $\mathcal{S}^*(a,b)$ can be reduced to several well known classes of starlike functions by selecting special values for a and b . In particular ,

$$\mathcal{S}^*(1-2\alpha,-1) = \mathcal{S}^*(2\alpha-1,1) = \mathcal{S}^*(\alpha) \qquad (0 \leqq \alpha < 1).$$

For Carathéodory functions , Nunokawa et al. [3] have given the following two theorems .

Theorem A. *If $p(z) \in \mathcal{P}$ satisfies*

$$\alpha(p(z))^2 + \beta zp'(z) \prec \frac{2\alpha+\beta}{2}\left(\frac{1+z}{1-z}\right)^2 - \frac{\beta}{2},$$

where $\beta > 0$ and $\alpha > -\frac{\beta}{2}$, then $\mathrm{Re}\,(p(z)) > 0 \quad (z \in \mathbb{E})$

Theorem B. *Let $p(z) \in \mathcal{P}$ and $w(z)$ be analytic in $\mathbb{E}$ with $w(0) = \alpha$ and $w(z) \neq ik$ $(k \in \mathbb{R}, z \in \mathbb{E})$. If*

$$\alpha(p(z)) + \beta\frac{zp'(z)}{p(z)} \prec w(z),$$

where $\alpha > 0$, $\beta > 0$ and $k^2 \geq \beta(2\alpha+\beta)$, then $\mathrm{Re}\,(p(z)) > 0 \quad (z \in \mathbb{E})$.

For the starlikeness of functions in $\mathcal{A}$, the following results have been proved .

Theorem C ([4]). *If $f(z) \in \mathcal{A}$ satisfies $f(z) \neq 0$ in $0 < |z| < 1$ and*

$$\mathrm{Re}\left\{\frac{zf'(z)}{f(z)}\left(1 + \frac{zf''(z)}{f(z)} - \frac{zf'(z)}{f(z)}\right)\right\} > -\frac{1}{2} \quad (z \in \mathbb{E}),$$

then $f(z) \in \mathcal{S}^*$.

Theorem D ([1]). *If $f(z) \in \mathcal{A}$ satisfies $f(z) \neq 0$ in $0 < |z| < 1$ and*

$$\mathrm{Re}\left\{\frac{zf'(z)}{f(z)}\left(\frac{zf''(z)}{f'(z)} + 1\right)\right\} > 0 \quad (z \in \mathbb{E}),$$

then $f(z) \in \mathcal{S}^*\left(\frac{1}{2}\right)$.

Theorem E ([5]). *If $f(z) \in \mathcal{A}$ satisfies $f'(z) \neq 0$ and*

$$\frac{f(z)f''(z)}{(f'(z))^2} \prec 2 - \frac{2}{(1-z)^2} \qquad (z \in \mathbb{E}),$$

then $f(z) \in \mathcal{S}^*$.

Theorem F ([5]). *If $f(z) \in \mathcal{A}$ satisfies $f'(z) \neq 0$ and*

$$\left|\frac{f(z)f''(z)}{(f'(z))^2}\right| < 2 \quad (z \in \mathbb{E}),$$

then $f(z) \in \mathcal{S}^*$.

In this paper we shall generalize or refine the above results .
To derive our results , we need the following lemma due to Miller and Mocanu [2] .

Lemma. *Let* $g(z)$ *be analytic and univalent in* $\mathbb{E}$, *and let* $\theta(w)$ *and* $\phi(w)$ *be analytic in a domain* $\mathbb{D}$ *containing* $g(\mathbb{E})$, *with* $\phi(w) \neq 0$ *when* $w \in g(\mathbb{E})$. *Set*

$$Q(z) = zg'(z)\phi(g(z)), h(z) = \theta(g(z)) + Q(z)$$

and suppose that
(i) $Q(z)$ *is univalent and starlike in* E , *and*
(ii) $\mathrm{Re}\left\{\dfrac{zh'(z)}{Q(z)}\right\} = \mathrm{Re}\left\{\dfrac{\theta'(g(z))}{\phi(g(z))} + \dfrac{zQ'(z)}{Q(z)}\right\} > 0 \quad (z \in \mathbb{E})$.
If $p(z)$ *is analytic in* $\mathbb{E}$, *with* $p(0) = g(0)$, $p(\mathbb{E}) \subset \mathbb{D}$ *and*

$$\theta(p(z)) + zp'(z)\phi(p(z)) \prec \theta(g(z)) + zg'(z)\phi(g(z)) = h(z),$$

then $p(z) \prec g(z)$ *is the best dominant of the subordination* .

2 Main results

Our main result is contained in

Theorem 1. *Let* a , b , λ *and* μ *satisfy either*

(i) $0 < a = -b \leqq 1$, $\lambda > -\dfrac{1}{2}$, $\mu \in \mathbb{C}$ *and* $\mathrm{Re}(\mu) \geqq 0$, *or*

(ii) $-1 \leqq b < a \leqq 1$, $\lambda \geqq 0$, $\mu \in \mathbb{C}$ *and* $\mathrm{Re}(\mu) \geqq -2\lambda\dfrac{(1-a)}{(1-b)}$.

If $p(z) \in \mathcal{P}$ *and*

$$\lambda(p(z))^2 + \mu p(z) + zp'(z) \prec h(z), \tag{1}$$

where

$$h(z) = \frac{a(\lambda a + \mu b)z^2 + (2\lambda a + \mu(a+b) + a - b)z + \lambda + \mu}{(1+bz)^2} \tag{2}$$

then $p(z) \prec \dfrac{1+az}{1+bz}$ *and* $\dfrac{1+az}{1+bz}$ *is the best dominant of* (1) .

Proof. Set

$$g(z) = \frac{1+az}{1+bz}, \theta(w) = \lambda w^2 + \mu w, \phi(w) = 1. \tag{3}$$

Then $g(z)$ is analytic and univalent in $\mathbb{E}$, $g(0) = p(0) = 1$, $\theta(w)$ and $\phi(w)$ are analytic with $\phi(w) \neq 0$ in the w-plane . The function

$$Q(z) = zg'(z)\phi(g(z)) = \frac{(a-b)z}{(1+bz)^2} \tag{4}$$

is univalent and starlike in $\mathbb{E}$ because

$$\mathrm{Re}\left\{\frac{zQ'(z)}{Q(z)}\right\} = \mathrm{Re}\left(\frac{1-bz}{1+bz}\right) > 0 \quad (z \in \mathbb{E}).$$

Further , we have

$$\theta(g(z)) + Q(z) = \lambda\left(\frac{1+az}{1+bz}\right)^2 + \mu\frac{1+az}{1+bz} + \frac{(a-b)z}{(1+bz)^2} \tag{5}$$

$$= \frac{a(\lambda a + \mu b)z^2 + (2\lambda a + \mu(a+b) + a - b)z + \lambda + \mu}{(1+bz)^2} = h(z)$$

and

$$\frac{zh'(z)}{Q(z)} = 2\lambda\frac{1+az}{1+bz} + \mu + \frac{1-bz}{1+bz}. \tag{6}$$

Therefore

(i) For $0 < a = -b \leqq 1$, $\lambda > -\frac{1}{2}$, and $\mathrm{Re}(\mu) \geqq 0$, it follows from (6) that

$$\mathrm{Re}\left\{\frac{zh'(z)}{Q(z)}\right\} = (2\lambda+1)\mathrm{Re}\left(\frac{1-bz}{1+bz}\right) + \mathrm{Re}(\mu) > 0 \quad (z \in \mathbb{E}).$$

(ii) For $-1 \leqq b < a \leqq 1$, $\lambda \geq 0$, and $\mathrm{Re}(\mu) \geqq -2\lambda\frac{(1-a)}{(1-b)}$, from (6) we get

$$\mathrm{Re}\left\{\frac{zh'(z)}{Q(z)}\right\} > 2\lambda\frac{1-a}{1-b} + \mathrm{Re}(\mu) \geqq 0 \quad (z \in \mathbb{E}).$$

Thus the function $h(z)$ in (5) is close-to-convex and univalent in $\mathbb{E}$. From (1) to (5) , we see that

$$\theta(p(z)) + zp'(z)\phi(p(z)) \prec \theta(g(z)) + zg'(z)\phi(g(z)) = h(z).$$

Therefore , by applying the lemma , we conclude that $p(z) \prec g(z)$ and $g(z)$ is the best dominant of (1) . The proof of the theorem is complete .

□

Remark 1. For $a = -b = 1$, $\lambda = \frac{\alpha}{\beta}$, $\beta > 0$, $\alpha > -\frac{\beta}{2}$ and $\mu = 0$, Theorem 1 (i) coincides with Theorem A by Nunokawa et al [3].

Corollary 1. *If $f(z) \in \mathcal{A}$ satisfies $f(z) \neq 0$ in $0 < |z| < 1$ and*

$$\frac{zf'(z)}{f(z)}\left(1 + \frac{zf''(z)}{f(z)} - \frac{zf'(z)}{f(z)}\right) \prec \frac{(a-b)z}{(1+bz)^2} (z \in \mathbb{E}) \tag{7}$$

for some a and b $(-1 \leqq b < a \leqq 1)$, then $f(z) \in \mathcal{S}^*(a,b)$.

Proof. Let $p(z) = \dfrac{zf'(z)}{f(z)}$. Then $p(z) \in \mathcal{P}$ and (7) can be written as

$$zp'(z) \prec \frac{(a-b)z}{(1+bz)^2} \tag{8}$$

Putting $\lambda = \mu = 0$ in Theorem 1 (ii) and using (8) , the desired result follows at once .

□

Remark 2. Corollary 1 with $a = 1 - 2\alpha$ $(0 \leqq \alpha < 1)$ and $b = -1$ implies that if $f(z) \in \mathcal{A}$ satisfies $f(z) \neq 0$ in $0 < |z| < 1$ and

$$\frac{zf'(z)}{f(z)}\left(1 + \frac{zf''(z)}{f(z)} - \frac{zf'(z)}{f(z)}\right) \prec 2(1-\alpha)\frac{z}{(1-z)^2},$$

then $f(z) \in \mathcal{S}^*(\alpha)$ and the order α is sharp for $f(z) = \dfrac{z}{(1-z)^{2(1-\alpha)}}$. When $\alpha = 0$, this result improves Theorem C by Owa and Obradović [4] .

Corollary 2. *If $f(z) \in \mathcal{A}$ satisfies $f(z) \neq 0$ in $0 < |z| < 1$ and*

$$\frac{z^2 f''(z)}{f(z)} + \frac{zf'(z)}{f(z)} + (\lambda - 1)\left(\frac{zf'(z)}{f(z)}\right)^2 \prec \frac{\lambda + z}{(1-z)^2} \qquad (z \in \mathbb{E}) \tag{9}$$

for some λ $(\lambda \geqq 0)$, then $f(z) \in \mathcal{S}^*\left(\dfrac{1}{2}\right)$ and the order $\dfrac{1}{2}$ is sharp .

Proof. If we let $p(z) = \dfrac{zf'(z)}{f(z)}$, then $p(z) \in \mathcal{P}$ and it follows from (9) that

$$\begin{aligned} \lambda(p(z))^2 + zp'(z) &= \frac{z^2 f''(z)}{f(z)} + \frac{zf'(z)}{f(z)} + (\lambda - 1)\left(\frac{zf'(z)}{f(z)}\right)^2 \\ &\prec \frac{\lambda + z}{(1-z)^2}. \end{aligned} \tag{10}$$

Taking $a = 0$, $b = -1$, $\lambda \geqq 0$ and $\mu = 0$ in Theorem 1 (ii) and using (10) , we know that $f(z) \in \mathcal{S}^*\left(\dfrac{1}{2}\right)$.

For $f(z) = \dfrac{z}{(1-z)}$, we have

$$\frac{z^2 f''(z)}{f(z)} + \frac{zf'(z)}{f(z)} + (\lambda - 1)\left(\frac{zf'(z)}{f(z)}\right)^2 = \frac{\lambda + z}{(1-z)^2}$$

and

$$\operatorname{Re}\left\{\frac{zf'(z)}{f(z)}\right\} \to \frac{1}{2} \quad as \quad z \to -1.$$

Hence the corollary is proved .

□

Remark 3. If we put $h(z) = \dfrac{\lambda + z}{(1-z)^2}$ $(\lambda > 0)$, then

$$h(e^{i\theta}) = -\frac{1 + \lambda cos\theta - i\lambda sin\theta}{2(1 - cos\theta)} \qquad (0 < \theta < 2\pi)$$

and hence

$$h(\mathbb{E}) = \left\{ w = u + iv : v^2 > -\frac{\lambda^2}{1+\lambda}\left(u - \frac{\lambda - 1}{4}\right) \right\},$$

which properly contains the half plane $\mathrm{Re}(w) > \dfrac{\lambda - 1}{4}$. Thus Corollary 2 with $\lambda = 1$ improves Theorem D by Li and Owa [1].

Corollary 3. *Let* $-1 \leqq b < a \leqq 1$ *and* $\mathrm{Re}(\mu) \geqq 0$. *If* $f(z) \in \mathcal{A}$ *satisfies* $f'(z) \neq 0$ *and*

$$(11) \qquad (1-\mu)\frac{f(z)}{zf'(z)} + \frac{f(z)f''(z)}{(f'(z))^2} \prec h(z) \qquad (z \in \mathbb{E}),$$

where

$$(12) \qquad h(z) = \frac{b(b - \mu a)z^2 + (3b - a - \mu(a+b))z + 1 - \mu}{(1+bz)^2},$$

then $f(z) \in \mathcal{S}^*(b, a)$.

Proof. Let us define $p(z)$ in $\mathbb{E}$ by

$$(13) \qquad p(z) = \frac{f(z)}{zf'(z)}.$$

Then $p(z) \in \mathcal{P}$ and it follows from (11) , (12) and (13) that

$$\mu p(z) + zp'(z) = 1 + (\mu - 1)\frac{f(z)}{zf'(z)} - \frac{f(z)f''(z)}{(f'(z))^2}$$

$$\prec \frac{\mu abz^2 + (\mu(a+b) + a - b)z + \mu}{(1+bz)^2} \qquad (z \in \mathbb{E}).$$

Therefore , by applying Theorem 1 (ii) with $\lambda = 0$ and $\mathrm{Re}(\mu) \geqq 0$, we have

$$p(z) = \frac{f(z)}{zf'(z)} \prec \frac{1+az}{1+bz}.$$

This implies that $f(z) \in \mathcal{S}^*(b, a)$. □

Remark 4. Letting $a = 1$, $b = -1$ and $\mu = 1$ in Corollary 3 , we get Theorem E by Tuneski [5].

For $a = 1$, $b = 0$ and $\mu = 1$, Corollary 3 lead to

Corollary 4. *If* $f(z) \in \mathcal{A}$ *satisfies* $f'(z) \neq 0$ *and*

$$\left| \frac{f(z)f''(z)}{(f'(z))^2} \right| < 2 \quad (z \in \mathbb{E}),$$

then $f(z) \in \mathcal{S}^*\left(\frac{1}{2}\right)$ *and the order* $\frac{1}{2}$ *is sharp for the function* $f(z) = \frac{z}{1-z}$.

Remark 5. Corollary 4 refines Theorem F by Tuneski [5].

Taking $a = 0$, $b = -c$ and $\mu = 1$ in Corollary 3 , we have

Corollary 5. *If* $f(z) \in \mathcal{A}$ *satisfies* $f'(z) \neq 0$ *and*

$$\frac{f(z)f''(z)}{(f'(z))^2} \prec 1 - \frac{1}{(1-cz)^2} \qquad (z \in \mathbb{E})$$

for some c $(0 < c \leqq 1)$, *then*

$$\left|\frac{zf'(z)}{f(z)} - 1\right| < c \qquad (z \in \mathbb{E}). \tag{14}$$

The bound c *in* (14) *is sharp for the function* $f(z) = ze^{-cz}$.

Next we derive

Theorem 2. *Let* $-1 \leqq b < a \leqq 1$, $\lambda \geqq 0$ *and* $\mu \geqq -\frac{1-a}{1-b}$. *If* $p(z) \in \mathcal{P}$ *with* $p(z) \neq -\mu$ $(z \in \mathbb{E})$ *and*

$$\lambda p(z) + \frac{zp'(z)}{p(z)+\mu} \prec h(z) \qquad (z \in \mathbb{E}), \tag{15}$$

where

$$h(z) = \frac{\lambda acz^2 + (\lambda(a+c)+c-b)z+\lambda}{(1+bz)(1+cz)}, c = \frac{a+\mu b}{1+\mu},$$

then $p(z) \prec \frac{1+az}{1+bz}$ *and* $\frac{1+az}{1+bz}$ *is the best dominant of* (15) .

Proof. We choose

$$g(z) = \frac{1+az}{1+bz}, \qquad \theta(w) = \lambda w, \qquad \phi(w) = \frac{1}{w+\mu}$$

and $\mathbb{D} = w : w \neq -\mu$ in the Lemma . Noting that

$$\operatorname{Re}(g(z)) > \frac{1-a}{1-b} \geqq -\mu \qquad (z \in \mathbb{E}), \tag{16}$$

the function $\phi(w)$ is analytic in $\mathbb{D}$ containing $g(\mathbb{E})$. From (16) we see that

$$1+\mu > 0, \qquad -1 \leq b < c = \frac{a+\mu b}{1+\mu} \leq 1.$$

The function

$$Q(z) = zg'(z)\phi(g(z)) = \frac{(c-b)z}{(1+bz)(1+cz)}$$

is univalent and starlike in $\mathbb{E}$ because

$$\operatorname{Re}\left\{\frac{zQ'(z)}{Q(z)}\right\} = -1 + \operatorname{Re}\left(\frac{1}{1+bz}\right) + \operatorname{Re}\left(\frac{1}{1+cz}\right)$$

$$> -1 + \frac{1}{1+|b|} + \frac{1}{1+|c|}$$
$$= \frac{1-|bc|}{(1+|b|)(1+|c|)} \geqq 0$$

for $z \in \mathbb{E}$. Further , we have

$$\theta(g(z)) + Q(z) = \lambda\frac{1+az}{1+bz} + \frac{(c-b)z}{(1+bz)(1+cz)} = h(z)$$

and

$$\mathrm{Re}\left\{\frac{zh'(z)}{Q(z)}\right\} = \lambda(1+\mu)\mathrm{Re}\left(\frac{1+cz}{1+bz}\right) + \mathrm{Re}\left(\frac{zQ'(z)}{Q(z)}\right)$$
$$> \lambda(1+\mu)\frac{1-c}{1-b} \geq 0 \quad (z \in E)$$

for $\lambda \geqq 0$. The other conditions of the lemma are seen to be satisfied . Hence $p(z) \prec g(z)$ and $g(z)$ is the best dominant of (15) . The proof is complete .

□

Remark 6. Note that the univalent function $h(z)$ defined by

$$h(z) = \frac{\alpha z^2 + 2(\alpha+\beta)z + \alpha}{1-z^2} = \alpha\frac{1+z}{1-z} + 2\beta\frac{z}{1-z^2} \quad (\alpha > 0, \beta > 0)$$

maps $\mathbb{E}$ onto the complex plane minus the half-lines

$$l_1 = w = u + iv : u = 0, \qquad v \geqq \sqrt{\beta(2\alpha+\beta)}$$

and

$$l_2 = w = u + iv : u = 0, \qquad v \leqq -\sqrt{\beta(2\alpha+\beta)}.$$

For $a = 1$, $b = -1$, $\lambda = \dfrac{\alpha}{\beta}$, $\alpha > 0$, $\beta > 0$ and $\mu = 0$, Theorem 2 reduces to Theorem B by Nunokawa et al [3] .

Theorem 2 with $\mu = 0$ and $p(z) = \dfrac{zf'(z)}{f(z)}$ leads to the following corollary .

Corollary 6. *Let $-1 \leqq b < a \leqq 1$ and $\lambda \geqq 0$. If $f(z) \in \mathcal{A}$ satisfies $f(z)f'(z) \neq 0$ in $0 < |z| < 1$ and*

$$(\lambda - 1)\frac{zf'(z)}{f(z)} + 1 + \frac{zf''(z)}{f'(z)} \prec h(z) \qquad (z \in \mathbb{E}),$$

where

$$h(z) = \frac{\lambda a^2 z^2 + (2\lambda a + a - b)z + \lambda}{(1+az)(1+bz)},$$

then $f(z) \in \mathcal{S}^*(a,b)$.
